DESIGNING OSCILLATORS IS AS MUCH AN ART AS A SCIENCE.
In today's sophisticated world, the designer must be concerned with additional parameters which are difficult to describe and measure; phase noise, AM noise, post-tuning drift, residual FM, tuning speed and repeatability are just a few of these. Providing customers with "State of the Art" oscillators takes a manufacturer with dedicated people and an awareness of our rapidly changing technology. EMF SYSTEMS INC. is this kind of company.
■ PHASE LOCKED OSCILLATORS ■ VCO's
■ SYNTHESIZERS ■ MULTIPLIERS
■ CRYSTAL OSCILLATORS ■ VCXO'S

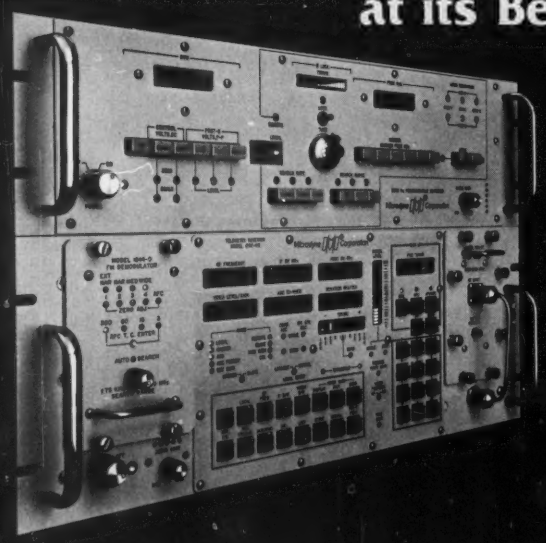
Telemetry Reception at its Best



Technical Note AS300-N-82-29, [illegible] by the Eastern Space [illegible], states that the 1200-MR Receiver/3200-PC Combiner System procured to support the MX Missile Program had greater than 10dB of improvement in data acquisition over a competitive combiner. This improvement provided quality data during solid rocket booster burn, Space Shuttle Orbiter antenna switching and accomplished a faster acquisition time during handovers.

These are the results of a test conducted at the NASA KSC Merritt Island Ground/Spaceflight-Tracking-Data Network using Microdyne 1200-MR microprocessor controlled telemetry receivers and companion 3200-PC combiner to evaluate their performance during a Space Shuttle Orbiter launch.

If our 1200-MR/3200-PC System provides this kind of performance under the severe signal perturbation and attenuation encountered during rocket booster burn, just think what Microdyne's telemetry receiving equipment can do in applications involving antenna tracking, communications satellites, meteorological satellite earth terminals, dual diversity reception and predetection magnetic record/playback data conversion and analysis.

Free Brochures!

Technical brochures on the field-proven 1200-MR with IEEE-488 interface, plug-in tuners and demodulators, and the 3200-PC with its unparalleled performance are ready for delivery. Give us a call or circle the Reader Service Number and your brochures will be on their way by return mail.

BOONTON

Why pay more for a Microwave Power Meter—

When the Boonton 4200 offers better performance for less. Display in dB or watts with up to 70 dB dynamic range. Automatic zero. Self-calibration to internal NBS-traceable reference. Selectable dB limits. DC output. Optional second input channel for direct display of insertion gain or return loss. Optional GPIB with SRQ for efficient bus operation.

A range of diode-type sensors covering 200 kHz to 18 GHz with sensitivities to as low as −60 dBm, levels up to +30 dBm with extended rms range, and high overload capability. Also available with thermocouple sensors for true average power readings of all waveforms at all levels. Calibration data for up to four interchangeable sensors can be stored in non-volatile RAM.

See your local representative or contact us directly for full information.
